WPI; 1997-192904/17. N-PSDB; AAT91455 New immunogenic polypeptide (s) from soluble M. tuberculosis antigens useful for diagnosis of M. tuberculosis infection.

Example 3; Page 150-152; 190pp; English.

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TbH-9FL The immunogenic polypeptide can be used to diagnose autibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen,

```
This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (WT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the
 Tuberculosis, immunogenic; soluble, antigen, protective immunity; vaccine, pharmaceutical, infection, diagnosis.
 Immunogenic Mycobacterium tuberculosis polypeptide(s) develop products for the detection of M. tuberculosis diagnosis; treatment and prevention of tuberculosis.
tuberculosis immunogenic polypeptide TbH-9FL

 This polypeptide comprises Mycobacterium tuberculosis antigen TbH-9FL. It is encoded by genomic DNA (see AAV44395) isolated from a M: tuberculosis strain H37RV genomic DNA (see AAV44395) isolated from a M: tuberculosis AAV44371). The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAV64291-V64379) comprising an antigenic portion of a Soluble M: tuberculosis antigen, or an immunogenic portion of a Soluble M: tuberculosis antigen, or an immunogenic portion of a Soluble M: tuberculosis antigen, as well as DNA transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M: tuberculosis infection in a patient winging these polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis of tuberculosis. (Updated on 17-OCT-2003 to standardise OS field)

 This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides; and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity

The sequence represents Mycobacterium tuberculosis TbH9 (also known as Mtb3A), an M. tuberculosis antigen. Compositions comprising at least 2 heterologous antigens, as a fusion protein, and vectors expressing the fusion proteins are used as vaccines to prophylactically immunise mammals (especially humans) against infection by Mycobacteria. The compositions contain at least 2 heterologous antigens that increase the serological sensitivity of individuals infected with tuberculosis, a disease frequently affecting patients with acquired immunodeficiency disease,

The invention relates to a recombinant nucleic acid molecule encoding a flusion polypeptide. The recombinant nucleic acid comprises a heterologous polynucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polynucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected

from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymuleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is Mycobacterium sp. TDH9FL antigenic protein

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and comprobations comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention are useful for elliciting an immune response in a manmal, e.g., human, immunised with BCG. They are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the polycobacterium, in vitro and in vivo assays for detecting humoral antibodies or cell-mediated immunity against M. tuberculosis, for the diagnosis to generate or monitoring of disease progression, as immunogens to generate or ellicit a protective immune response in a patient and for raising anii. M. tuberculosis antibodies in a non-human immal. Sequences of the invention are also used as vaccines. MTB32A fusion proteins of the invention are also used as vaccines. MTB32A fusion proteins of the invention are also used as vaccines. MTB32A fusion proteins of the invention are also used as vaccines.
 Composition comprising MTB39 antigen and MTB32A antigen from

N-PSDB; AAZ20205

New fusion proteins useful for diagnosis, prevention and treatment of tuberculosis.

Claim 1; Fig 12A-B; 83pp; English.

This sequence represents a recombinant Mycobacterium tuberculosis biantigen fusion protein, termed Mtb59f, composed of the antigens TbH9 and Rais. The fusion protein is expressed in host cells using a vector carrying a polymucleotide (see AAZ20205) comprising the coding sequences for the 2 antigens. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polymucleotides encoding them are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein

The invention relates to a purified polypeptide which induces an immune response of Mycobacterium tuberculosis. Polypeptides of the invention are useful for diagnosing, treating or preventing M. tuberculosis infection, particularly tuberculosis infection. In particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protein coding sequence may be used to encode a protein product for use as an immunogen to induce and/or enhance an immune response to M. tuberculosis. This sequence represents an M. tuberculosis fusion protein of the invention. (Updated on 29-AUG-2003 to standardise OS field)

 GENERAL INFORMATION:
APPLICANT: Reed, Steven G.
APPLICANT: Reed, Steven G.
APPLICANT: Skeiky, Yasir A.W.
APPLICANT: Dillon, Davin C.
TITLE OF INVENTION: COMPOUNDS AND METHODS FOR THE PREVENTION AND NUMBER OF SEQUENCES: 241
CORRESPONDENCE ANDRESS:
ADDRESSEE: SEED and BERRY LLP
 í,
 Length 391;
 Indels
 ZIF: 99104-7092
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IEM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/09/056,556
 ; Score 1949; DB 4;
; Pred. No. 2.9e-154;
0; Mismatches 0;
 STATE: Washington
COUNTY: USA

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

fusion polypeptide. The recombinant nucleic acid comprises a heterologous bolynucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polynucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polynucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is a honk encoding MTSPZ fusion protein. This fusion protein comprises Ral2 and Ra35 protein from Mycobacterium tuberculosis and TbH9 protein from Mycobacterium tuberculosis and TbH9 protein from Mycobacterium tuberculosis and TbH9 protein from Mycobacterium tuberculosis and TbH9 protein from 120 120 180 240 300 480 240 300 360 360 420 480 540 540 600 420 600 9 9 720 720 780 09 9 1 reragaaaraarrerrracrrraagaanganararacaraccarcaccarc ATATCGGGCCTACCGCCTTGGGTGTTGTCGACAACAACGGCAACGGCGAC TCTAGAAATAATTTTGTTTACTTTAAGAANGANATATACATATGCATCACCATCACCATC 61 ACACGGCCGCCGTCCGATAACTTCCAGCTGCCAGGGTGGGCAGGGATTCGCCATTCCGA rcesscassecarcecearceceaccagarcecarcesorecesscarcecarcearce GAGTCCAACGCGTGGGAGGCGCTCCGGCGGCAAGTCTCGGCATCTCCCACCGGGACG GAGTCCAACGCGTGGTCGGGAGCGCTCCGGCGAAGTCTCGGCATCTCCACCGGCGACG 181 ATATCGGGCCTACCGCCTTCCTCGGCTTGGTCGACAACAACGGCAACGGCGCAC TGATCACCGCGGCGCTCCGATCAACTCGGCCACCGCGATGGCGGACGCGCTTA TGATCACCGCGTCGACGCCGCTCCGATCAACTCGGCCACCGCGATGGCGGACGCGCTTA 361 ACGGGCATCATCCCGGTGACGTCATCTCGGTGACCTGGCAAACCAAGTCGGGCGGCACGC GTACAGGGAACGTGACATTGGCCGAGGGACCCCCGGCCGAATTCATGGTGGATTTCGGGG GTACAGGGAACGTGACATTGGCCGAGGGACCCCCGGCCGAATTCATGGTGGATTTCGGGG Cerraccaccesagarcaacroceceaegareraceceeecceeerroeecroecree ACGGGCATCATCCGGGTGACGTCATCTCGGTGACCTGGCAAACCAGGTCGGCGGGCACGC CGTTACCACCGGAGATCTACTCCGCGAGGATGTACGCCGGCCCCGGGTTCGGCCTCG TGGCCGCGCTCAGATGTGGGGACAGCGTGGCGAGTGACCTGTTTTCGGCCGCGTCGGCGT TGGCCGCGCCTCAGATGTGGGACAGCGTGGCGAGTGACCTGTTTTCGGCCGCGTCGGCGT TTCAGTCGGTGGTCTGGGGTCTGGGGGTCGTGGATAGGTTCGTCGGCGGGTCTGA Trcagrosordadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescricidadescr TGGTGGCGCCGCCTCGCCGTATGTGGCGTGGATGAGCGTCACCGCGGGGCAGGCCGAGC TGGTGGCGGCGGCCTCGCCGTATGTGGCGTGGATGAGCGTCACCGCGGGGGCAGGCCGAGC TGACCGCCGCCCAGGTCCGGGGTTGCTGCGGCGCCTACGAGACGGCGTATGGGCTGACGG .; 0 DB 6; Length 2287; Sequence 2287 BP; 372 A; 717 C; 814 G; 381 T; 0 U; 3 Other; 0; Indels 99.9%; Score 2284; Dilarity 100.0%; Pred. The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with cuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention are creatment of tuberculosis infection. Sequences of the invention and treatment of They are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the prevention of Mycobacterium infection. The fusion proteins and the Mycobacterium, in vitro and in vivo assays for detecting humoral antibodies or cell-mediated immunity against M. tuberculosis, for the diagnosis of an infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human patient and for raising anti-M. tuberculosis antibodies in a non-human continuation are useful as a vaccines. MTB32A fusion proteins of the invention are useful as in vivo diagnostic agents Mycobacterium species MTB72F (Raiz-TDH9-Ra35) fusion protein

```
This DNA sequence includes a coding region for a recombinant Mycobacterium tuberculosis tri-antigen fusion protein (see AAY32059), termed Mtb322A, composed of the antigens Ral2, Tb49 and Ra35. The DNA is useful for the recombinant production of the fusion protein. Coding sequences for the antigens were modified by PCR in order to facilitate their fusion and subsequent expression of the fusion protein. 3 Coding sequences for Ral2, Tb49 and Ra25 were ligated to encode Mtb32A. The invention provides fusion proteins (see AAY32059-71) containing at least invention provides fusion proteins (see AAY32059-71) containing at least concoding them are useful as vacaines for preventing tuberculosis concoding them are useful as vacaines for preventing tuberculosis (claimed). For diagnosis (via in vitro assays or intradermal skin tests for for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein components
 Example; Fig 1A-B; 83pp; English.

The invention relates to a purified polypeptide which induces an immune response of Mycobacterium tuberculosis. Polypeptides of the invention are useful for diagnosing, treating or preventing M. tuberculosis infection, particularly tuberculosis infection. In particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protein coding sequence may be used to encode a protein product for use as an immunogen to induce and/or enhance an immune response to M. tuberculosis. This sequence represents DNA encoding an M. tuberculosis (usion protein of the invention. (Updated on 29-AUG-2003 to standardise OS field)

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 (basion polypeptide, comprising a polynucleotide sequence of Ral2, and a heterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequence can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polynucleotide sequence

 The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a WTB32A and MTB39 antigen, or WTB22A, WTB39 and WTB83A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polynucelotide of the invention may have a use in gene therapy, and as a vaccine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.
 New isolated nucleic acid encoding a fusion polypeptide with the MTB32A and MTB33 antigens, with or without the MTB85A antigen, from a Mycobacterium species, useful for diagnosing, preventing and/or treating tuberculosis infection.

CORIXA CORP

WPI; 2003-697554/66 P-PSDB; ADA26366.

New isolated nucleic acid encoding a fusion polypeptide with the MTB32A and MTB39 antigens, with or without the MTB85A antigen, from a Mycobacterium species, useful for diagnosing, preventing and/or treating tuberculosis infection.

English. 84; Fig 7; 112pp; Claim

The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or WTB32A, MTB32B, MTB35A and MTB85A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polypeptide of the invention may have a use in gene therapy, and as a polynucelotide of the invention may have a use in gene therapy, and as a vaccine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or MTB32A, MTB39 and MTB85A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polymucelotide of the invention may have a use in gene therapy, and as a polymucelotide of the invention may have a use in gene therapy, and as a polymucelotide of the invention may have a use in gene therapy, and as a vaccine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polynucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polynucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are

| useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polynucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is Mycobacterium sp. MTB72F-Leishmania sp. thiol specific antioxidant [TSA; MAPS (aka 195f)] fusion DNA. This sequence comprises Mycobacterium sp. MTB72F (a 72 kDa poly-protein fusion construct comprises Mycobacterium sp. linked to the Leishmania TSA (MAPS).  The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or MTB32A, MTB32A MTB35A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polypucclotide of the invention may have a use in gene therapy, and as a vaccine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present is used in the exemplification of the invention.
 New isolated nucleic acid encoding a fusion polypeptide with the MTB32A and MTB33 antigens, with or without the MTB35A antigen, from a Mycobacterium species, useful for diagnosing, preventing and/or treating tuberculosis infection.

 The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or MTB32A, MTB32A and MTB85A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polymucelotide of the invention may have a use in gene therapy, and as a vaccine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

 The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or WTB32A, MTB39 and MTB35 antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polynucelotide of the invention may have a use in gene therapy, and as a polynucelotide of the invention may have a use in gene therapy, and as a postone. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, M15 or 6H polynucleotide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis.

Disclosure, Page 92-93; 155pp; English.

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polypurdeocitide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polynucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention care used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polynucleotides, as in vivo diagnostic agants and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is a nimal. The invention is used in gene therapy. The present sequence is a mimal. The invention and Ralz protein from M. tuberculosis and TDH9 protein from Mycobacterium sp. (Updated on 29-AUG-2003 to standardise OS protein from Mycobacterium sp. (Updated on 29-AUG-2003 to standardise OS field)

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sara from individuals infected with increase treatment of tuberculosis infection. Sequences of the invention and treatment of luberculosis infection. Sequences of the invention and the sevention of Mycobacterium infection. The fusion proteins and the prevention of Mycobacterium infection. The fusion proteins and the prevention of Mycobacterium in vitro and in vivo assays for detecting humoral antibodies or call-mediated immunity against M. tuberculosis, for the diagnosis of an infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human animal. Sequences of the invention are also used as vaccines. MTB32A fusion proteins of the invention are useful as in vivo diagnostic agents for intradermal skin test. The present sequence is a DNA encoding Mycobacterium species MTB72FMutSA (Ral2-TDH9-Ra35MutSA) mutant fusion
 Composition comprising MTB39 antigen and MTB32A antigen from Mycobacterium species, useful for eliciting immune response in a subject.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 University Submitted (02-UNN-1999) Genoscope - Centre National de Sequencage : Submitted (02-UNN-1999) Genoscope - Centre National de Sequencage : PRANCE (B-mail : seqref@genoscope.cns.fr - Web : www.genoscope.cns.fr)
Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDCP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazlucyo Coscegawa and Aaron Mammoser in Pieter d Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is anamed RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's pl and how to order individual BAC clones, the entire library, and how to order individual BAC clones, the entire library, and how to order individual BAC clones, the entire library or filters for hybridization from the BACPAC Resource Center can be incation/Qualifiers

About this library, constructed by John Davies and Jeffrey McDeamott, combines colbas from CC-1690 ceals grown to mid-log phase in TAP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2. PolyA mRNA was purified from each sample, pooled and CDNA synthesized. The CDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5) and XhoI (3') sites. pBaluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with EXAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806." /mol\_type="mxxn" /purain="cC-1690 wild type mt+ 21gr" /db\_xref="taxon:3055" /db\_clone\_lib="C. reinhardtii CC-1690, normalized, Lambda Zap II" 1. .1160 /organism="Chlamydomonas reinhardtii" Location/Qualifiers DCMB Box 91000

```
A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen,
 New immunogenic polypeptide(s) from soluble M. tuberculosis antigens useful for diagnosis of M. tuberculosis infection.
 Antigen; immunogen; vaccine; tuberculosis; non specific adjuvant;
skin testing; M.tuberculosis.
 Campos-Neto A,
 ALIGNMENTS
 Mycobacterium tuberculosis antigen TbH-9.

 A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TbH-9. The immunogenic protein, and fusion proteins containing one or more of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or

 This polypeptide comprises Mycobacterium tuberculosis antigen TbH-9. A DNA sequence (see AAV44371) coding for antigen TbH-9 was isolated from a N. tuberculosis strain H37Rv expression library using sera from patients having pulmonary or pleural tuberculosis. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigenic portion of a soluble Mr. tuberculosis antigen, or an immunogenic portion of an tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis of tuberculosis. (Updated on 17-0CT-2003 to standardise OS

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polymucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polymucleotide sequence encoding a polypeptide or its fragment. The Leishmania polymucleotide is selected from TSA, LeIF, MIS, and 6H polymucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is Mycobacterium sp. TDH9 antigenic protein

The invention relates to a purified polypeptide which induces an immune response of Mycobacterium tuberculosis. Polypeptides of the invention are useful for diagnosing, treating or preventing M. tuberculosis infection, particularly tuberculosis infection. In particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protein coding sequence may be used to encode a protein product for use as an immunogen to induce and/or enhance an immune response to M. tuberculosis. This sequence represents an M. tuberculosis fusion protein of the invention. Note: The specification states that this polypeptide is encoded by the polynucleotide shown in ABK14131.  SGVSMTNTLSSMLKGFAPAAAAQAVQTAAQNGVRAMSSLGSSLGSSGLGGGVAANLGRAA 313
 This polypeptide comprises Mycobacterium tuberculosis antigen TbH-9FL. Is encoded by genomic DAM (see AAV44395) isolated from a M. tuberculosis strain H37Rv genomic library using a probe from clone TbH-9 (see AAV44371). The invention ralates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW44291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, as well as DNA transformed or transfected host cells. Also claimed expression vectors and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, recombinant expression vectors and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonuclectide probes and primers, for the diagnosis of tuberculosis. (Updated on 17-OCT-2003 to standardise OS field)

 A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TbH-9FL The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins place. SSAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or

This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis

ó
 Mycobacterial DNA vectors containing reporter constructs - for identifying coding or promoter sequences involved in infection-associated protein expression.
 Sequences AAY04742-Y05000 and AAY07201-Y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection

 probable PPE protein - Mycobacterium tuberculosis (strain H37RV)
C;Species: Mycobacterium tuberculosis
C;Species: Mycobacterium tuberculosis
C;Date: 1.-Jul-1998 #sequence_revision 17-Jul-1998 #text_change 22-Oct-1999
C;Accession: F70660
R;Cole, S.T.; Brosch, R.; Parkhill, J.; Garnier, T.; Churcher, C.; Harris, D.; Gordon, S.; Connor, R.; Davies, R.; Devlin, K.; Feltwell, T.; Gentles, S.; Hamlin, N.; Holroyd, S. Rajandream, M.A.; Rogers, J.; Rutter, S.; Seeger, K.; Skelton, S.; Squares, S.
Nature 393, S37-544, 1998
A;Authors: Sqares, R.; Sulston, J.E.; Taylor, K.; Whitehead, S.; Barrell, B.G.
A;Authors: Deciphering the biology of Mycobacterium tuberculosis from the complete genome A;Reference number: A70500; MulD:98295987; PMID:9634230
 A;Cross-references: GB:295436; GB:AL123456; NID:g3261770; PIDN:CAB08826.1; PID:e316565; A;Experimental source: strain H37RV C;Genetics: A;Genetics: Cyaccession: B70625

-i. SUBCELLUIAR LOCATION: Membrane-bound (Potential).
-i. INDUCTION: Induced by heat shock during exponential growth and by heterologous amylases at the transition phase of the growth cycle. Negatively regulates its own expression.
-i. MESCELLAMSOUS: Inactivation resulte in compensating overexpression of htth, especially during stress conditions.
-i. SIMILARITY: Belongs to peptidase family S2C.
-i. SIMILARITY: Contains I PDZ/DIR domain.
-i. CAUTION: Ref. 2 and Ref. 3 sequences differ from that shown due to frameshifts in positions 87 and 246 that produce two separate

```
The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous bolynucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polynucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic
 New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polynuclectide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium

microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is MTB72F fusion protein. This fusion protein comprises Ralz and Rals protein from M. tuberculosis and Th99 protein from Mycobacterium sp. (Updated on 29-AUG-2003 to standardise OS field)

 Wycobacterium species antigens, nucleotides encoding them and compositions comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention are useful for eliciting an immune response in a mammal, e.g., human, immunised with BGG. They are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the polynucleotides are useful as diagnostic tools in patients infected with Mycobacterium, in vitro and in vivo assays for detecting humoral antibodies or cell-mediated immunity against M. tuberculosis, for the
 NNGNGARVQRVVGSAPAASLGISTGDVITAVDGAPINSATAMADALNGHHPGDVISVTWQ 120
 diagnosis of an infection or monitoring of disease progression, as immunosens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human animal. Sequences of the invention are also used as vaccines. MTB32A fusion proteins of the invention are useful as in vivo diagnostic agents for intradermal skin test. The present sequence is a DNA encoding Mycobacterium species MTB72F (Ral2-TDH9-Ra35) fusion protein

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 kasion polypeptide, comprising a polynucleotide sequence of reterminal fragment of serine protease antigen MTB32A of for the recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serium antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the fusion polypeptides are useful as cources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another can be used in vivo as a DNA vaccine. This sequence represents the Ral2-

 The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or MTB32A, MTB32A and MTB385A antigen. From a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polymucelotide of the invention may have a use in gene therapy, and as a vaccine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

```
fusion polypeptide. The recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous conjuncted properties and the recombinant polymucleotide sequence encoding and polymucleotide sequence encoding a polymucleotide sequence encoding a conjupeptide or its fragment. The Leishmania polymucleotide sequence encoding a polympeptide or its fragment. The Leishmania polymucleotide is selected from TSA, LeIF, MIS, and 6H polymucleotides. Sequences of the invention consetul as vaccines to elicit protective immunity against pathogenic conjupeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human conjunction is used in gene therapy. The present sequence is mycobacterium sp. MTB72F-Leishmania sp. thiol specific antioxidant [TSA; MAPS (aka 1957) fusion protein. This sequence comprises Mycobacterium species MTB72F (a 72 kDa poly-protein fusion construct comprising Ral2-CT TDH9-Ra35) linked to the Leishmania TSA (MAPS). (Updated on 29-AUG-2003 CX to standardise OS field)
 ö
new recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polynucleotide, useful as vaccine to elicit protective immunity against parhogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis.

 The invention relates to a novel nucleic acid encoding a fusion by peptide, comprising a MTB32A and MTB39 antigen, or MTB32A, MTB35 and MTB85A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polypurclotide of the invention may have a use in gene therapy, and as a vaccine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

 The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or WTB32A, WTB32A and MTB39 antigen. From a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polypeptide of the invention may have a use in gene therapy, and as a voccine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

The invention relates to a novel nucleic acid encoding a fusion polypeptide, comprising a MTB32A and MTB39 antigen, or WTB32A, MTB39 and MTB35A antigen from a Mycobacterium species of the tuberculosis complex. A polypeptide of the invention has tuberculostatic activity. A polymucelotide of the invention may have a use in gene therapy, and as a yectine. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating tuberculosis infection. The present sequence is used in the exemplification of the invention.

 The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polypuclectide sequence encoding an antigen or an antigenic fragment from polypuclectide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide sequence encoding a polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, MIS, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polynucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is mimal. The invention from My tuberculosis and TDH9 protein from Mycobacterium sp. (Updated on 29-AUG-2003 to standardise OS field)

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with increase the exploration and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention and treatment of tuberculosis infection. Sequences of the invention and treatments of with EGG. They are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the proteintes are useful as diagnostic tools in patients infected with Mycobacterium, in vitro and in vivo assays for detecting humoral antibodies or cell-mediated immunity against M. tuberculosis, for the diagnosis of an infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human animal. Sequences of the invention are also used as vaccines. WTB32A fusion proteins of the invention are also used as vaccines for the invention are also used as vaccines for intradermal skin test. The present sequence is Mycobacterium species membra of the invention are sequence is Mycobacterium species membra of the invention are sequence is Mycobacterium species membra of the invention are sequence is Mycobacterium species.
Composition comprising MTB39 antigen and MTB32A antigen from Mycobacterium species, useful for eliciting immune response in a subject.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence represents a recombinant Mycobacterium tuberculosis bi-
antigen Kusion protein, termed Mtb59f, composed of the antigens ThH9 and
Ra35. The fusion protein is expressed in host cells using a vector
carrying a polynucleotide (see AAZ20205) comprising the coding sequences
 New fusion proteins useful for diagnosis, prevention and treatment of tuberculosis.

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous computed sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a leishmania polymucleotide sequence encoding a polymucleotide sequence encoding a polymucleotide sequence encoding a polymorphide or its fragment. The Leishmania polymucleotide is selected from TSA, Leif, MIS, and 64 polymucleotides. Sequence of are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic nicroorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polympetides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agants and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is minal. The invention protein raising protein from Mycobacterium tuberculosis and TDH9 protein from Mycobacterium tuberculosis and TDH9 protein from Mycobacterium sp.

for the 2 antigens. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polynucleotides encoding them are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), amonitoring of disease progression, and treatment of tuberculosis. They are more effective immunoges than mixtures of the individual protein

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and compositions comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with cuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention are useful for eliciting an immune response in a mammal, e.g., human, immunised with BGC. They are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the polymoleotides are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the mycobacterium, in vitro and in vivo assays for detecting humoral antibodies or cell-mediated immunity against M. tuberculosis, for the diagnosis to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human patient and sequences of the invention are also used as vaccines. WHEALSAA fusion proteins of the invention are useful as in vivo diagnostic agents for integers and sevents sequence is Mycobacterium species
 Composition comprising MTB39 antigen and MTB32A antigen from Mycobacterium species, useful for eliciting immune response in a subject.

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polymucleotide sequence of Ral2, a 14 can be combinant fragment of serine protease antidem WHE32A of the Corporation rules, and a heterologous polymucleotide sequence. Mycobacterium tuberculosis, and a heterologous polymucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both enkaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the fusion polypeptides are useful as cources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another complexible and as an its truberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This sequence represents the Ral2-

 The invention relates to a purified polypeptide which induces an immune response of Mycobacterium tuberculosis. Polypeptides of the invention are useful for diagnosing, treating or preventing M. tuberculosis infection, particularly tuberculosis infection. In particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protein coding sequence may be used to encode a protein product for use as an immunogen to induce and/or enhance an immune response to M. tuberculosis. This sequence respensents an M. tuberculosis fusion protein of the invention. (Updated on 29-AUG-2003 to standardise OS field)

 The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polymucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polymucleotide sequence encoding a polymeptide or its fragment. The Leishmania polymucleotide is selected from TSA, LeIF, M15, and 6H polymucleotides. Sequences of the invention
 recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, or 6H polynucleotide, useful as vaccine to elicit protective immunity inst pathogenic microorganisms e.g. Leishmania and Mycobacterium

are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in animal. The invention is used in gene therapy. The present sequence is Mycobacterium sp. MTB12F-Leishmania sp. thiol specific antioxidant [TSA MAPS (aka.195f)] fusion protein. This sequence comprises Mycobacterium species MyrB12F (a 72 Na poly-protein fusion construct comprising Ral2-TB49-Ra35) linked to the Leishmania TSA (MAPS). (Updated on 29-AUG-2003 to standardise OS field)

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polymucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polymucleotide sequence encoding a polymucleotide sequence encoding a polymucleotide sequence encoding a polymorphy of the invention from TSA, LeIF, MIS, and 6H polymucleotides. Sequences of the invention or useful as vaccines to eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microgranisms such as Leishmania and Mycobacterium tuberculosis. Fusion polymeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human conjugation protein. The invention is used in gene therapy. The present sequence is mimal. The invention is used in gene therapy. The present sequence is Mycobacterium sp. (Updated on 29-AUG-2003 to standardise OS field)
 New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polynucleotide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the strological sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention and treatment of tuberculosis infection. Sequences of the invention and treatment of tuberculosis infection. Sequences of the invention and prevention of Mycobacterium infection. The diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the polymorlectides are useful as diagnostic tools in patients infected with Mycobacterium, in vitro and in vivo assays for detecting humoral antibodies or cell-mediated immunity against M. tuberculosis, for the diagnosis of an infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human animal. Sequences of the invention are also used as vaccines. MTB32A furstradermal skin test. The present sequence is Mycobacterium species mTB72FMutSA (Ral2-TbH9-Ra35MutSA) mutant fusion protein
